Converting an NFA to a DFA

Given:

A *non-deterministic* finite state machine (NFA)

Goal:

Convert to an equivalent *deterministic* finite state machine (DFA)

Why?

Faster recognizer!

Approach:

Consider simulating a NFA.
Work with sets of states.
IDEA: Each *state* in the DFA will correspond to a *set of* NFA states.

Worst-case:

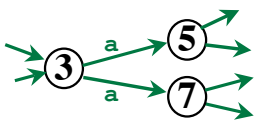
There can be an exponential number $\mathbf{O}(2^N)$ of sets of states.
The DFA can have exponentially many more states than the NFA
... but this is rare.

NFA to DFA

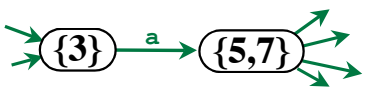
Input: A NFA
S = States = $\{ s_0, s_1, ..., s_N \} = S_{NFA}$
δ = Move function = $Move_{NFA}$
Move'(S, a) → Set of states

Output: A DFA
S = States = $\{?, ?, ..., ?\} = S_{DFA}$
δ = Move function = $Move_{DFA}$
Move(s, a) → Single state from S_{DFA}

Main Idea:
Each state in S_{DFA} will be a set of states from the NFA
$S_{DFA} = \{ \{...\}, \{...\}, ..., \{...\} \}$

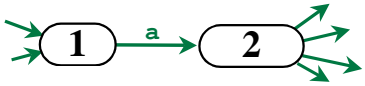


NFA



DFA

(The names of the states is arbitrary and can be changed later, if desired.)



Algorithm: Convert NFA to DFA

We'll use...

$Move_{NFA}(S,a)$	the transition function from NFA
ε-Closure(s)	where s is a single state from NFA
ε-Closure(S)	where S is a set of states from NFA

We'll construct...

S_{DFA} the set of states in the DFA

Initially, we'll set S_{DFA} to {}

Add X to S_{DFA} where X is some *set of* NFA states

Example: "Add {3,5,7} to S_{DFA}"

We'll "mark" some of the states in the DFA.

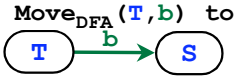
Marked = *"We've done this one"* (√)

Unmarked = *"Still need to do this one"*

$Move_{DFA}(T,b)$ The transition function from DFA

To add an edge to the growing DFA...

Set $Move_{DFA}(T,b)$ to S



...where S and T are sets of NFA states

Σ= {a,b}
